CFPB Complaint Risk Control Tower

What this demo does

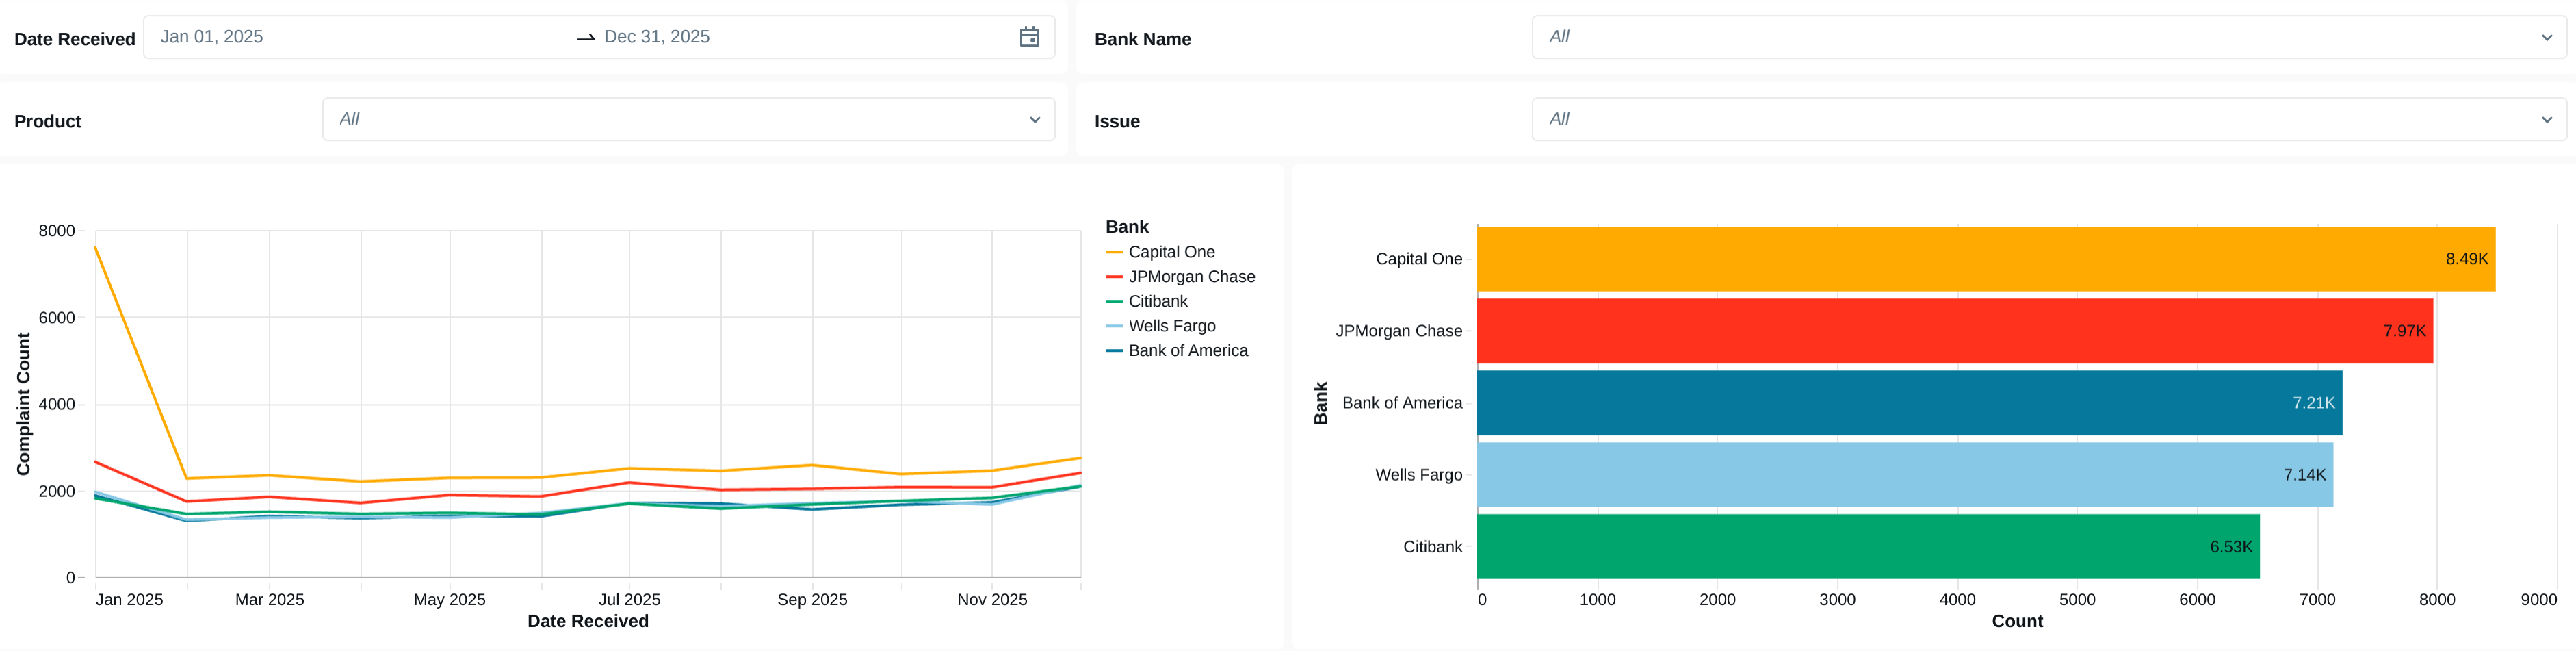

This demo uses complaint data from the Consumer Financial Protection Bureau (CFPB) to identify elevated complaint patterns by institution, product, issue, and month for five banks. Query logic evaluates the complaints based on several simple and explainable risk tests to calculate risk scores. Any high-risk complaint trends are escalated as "Issues" to be triaged and resolved by bank employees.

Design Notes

This project uses explainable scoring rather than ML, a medallion lakehouse structure, persistent workflow tables, and deterministic IDs. It is intentionally scoped as a simple V1/proof of concept rather than a full complaint management platform.

How to Read this Page - Peer Comparison

This Dashboard Page presents a high-level summary of complaint data and compares complaint volumes over time and between different banks. Analyses like these are used to monitor regulator and media/reputation risk.
